Abstract of the Disclosure

A system for providing wireline telephone services to wireless subscribers utilizing a packet data network **100**. The system includes a base station controller
5 (BSC) **210** and base station controller gateway (BGW) **200** for providing client based services to mobile subscribers and providing protocol mapping between a mobile protocol and a packet data network protocol. The system further comprises a mobility gatekeeper (GK) **500** for managing network mobility services for each wireless call including the establishment of a call control path and a speech path between said base
10 station controller and a serving end office telephony point. The system also comprises a end office gateway (EOGW) **300** for providing protocol conversion between the packet data network protocol and the end office point data protocol such that a wireless subscriber has access to all wireline services provided by the end office point. A mobile switching center (MSC) **410** and mobile switching center gateway (MGW) **400**
15 are included to facilitate inter-system call handoffs into an existing circuit-switched wireless telephony network.
